Animal testing, also known as animal experimentation, animal research and in vivo testing, is the use of non-human animals in experiments that seek to control the variables that affect the behavior or biological system under study. This approach can be contrasted with field studies in which animals are observed in their natural environments or habitats.

Frølich et al. reported satisfactory preservation of cadavers embalmed between 8 and 48 h post-mortem. When embalming is usually undertaken within 24 h of death and embalment uses formalin, this results in adequate preservation of tissues for dissection and satisfactory quality of histological sections (Nicholson et al. 2005).
